

Stephen Hawking

Stephen Hawking died the 14th March 2018 because of his illness. He was one of the most famous Scientists in the world.

He was born on the 8th January 1942 in Oxford, England. When he was 21, in 1963, doctors discovered that he had an illness with motor neurons. They told him that he was going to live only two more years.

However, he continued his life and doing what he loved to do, Maths. He studied at Oxford University first and then at Cambridge University. In 1979 he became a Maths Professor at Cambridge.

After some years, in 1988, he published a book and sold more than 10 million copies, it was about the theory of Cosmology. Also, General Relativity and Quantum Gravity, especially in the context of black holes.

He got married two times and he had three children. His personal life wasn't always easy but he was clearly loved.

Hawking, although he had more difficulties than other people, he did amazing, extraordinary things. Stephen Hawking is one person we should admire because his life wasn't easy but he did things with his effort and dedication that others couldn't. What he did during his life we are going to have for a thousand of years more.

Goodbye and thanks Professor Stephen Hawking.
